

THE HINGE

In the centre-pivot roof windows the hinge is placed in the middle of the frame and allow the sash to be tilted to any angle for ventilation or rotated by 180° for easy cleaning it also allow very easy sash removing during installation process. The hinge is made of durable metal which is rust and weather resistant.

THE BOLT

The bolt placed on the top corner of the sash can lock the sash in tilted of 20° positions and also secured the sash rotated through 180° during the cleaning of the outer pane.

THE HANDLE

The handle is the most using part of the roof window and for this reason we assure reliability and functionality of this element.

The handle is positioned on the bottom part of the window making it easier to use, even when the window is installed high above the floor level. The handle design enables micro openings for ventilation.

COVERING PROFILES

All covering profiles in OKPOL windows are made of aluminium sheet covered with weather and UV resistant polyester - NEW CLADDING DESIGN. Aluminium is rust-proof and also very light materials which thanks to those advantages are used during the production process of the roof windows.
